

Counting Products Guide

DEFENDER™5000

RANGER™COUNT 4000

SCOUT™STX

Ingeniously Practical

Introduction

There are many ways to count, but only Counting Scales offer the best combination of accuracy, ease of setup and cost.

All Counting Scales use the weight of a sample of parts to create an **Average Piece Weight** ("APW") which is then used to count the pieces on the scale by dividing the weight by the APW in memory. The APW can be based on a sample of parts on the pan, or it can be a preset weight value that is entered into the scales' memory.

Counting Scales have a **Displayed Resolution** and an **Internal Counting Resolution**. The Displayed Resolution is based on the **Capacity** of the scale – the total weight it can measure – divided by the smallest weight it can show on the display (the **Readability** of the scale). The Internal Counting Resolution is several times higher than this and is the scale's ability to count using a sample. This resolution is defined by both the **Minimum APW** – the smallest piece weight the scale can support – as well as the **Minimum Sample Weight** – the smallest weight of the sample the scale can use. As a sample can be made up of many pieces, the Minimum APW is always a fraction of the Minimum Sample Weight. Both specifications are used to ensure that the scale you use can precisely count your parts with a low error.

Many OHAUS counting scales and balances include software that will alert you if the Minimum APW or Sample Weight is too light. We also include software that will automatically update the APW (**APW Optimization**) as you continue to count parts, refining the APW as you use the scale. This not only reduces the errors found from miscounting a large sample – you can start with 10 pieces and add more to reach a sample of 100 pieces – but it helps minimize errors from very slight part weight changes over time. Scales with numeric keypads will also allow **Preset APWs** where you already know what the part should weigh and can just punch it into the scale. For a large number of different parts, **Libraries** allow quick recall of information, speeding use.

Whether it is a R&D lab, a parts bin on the shop floor, or a quick inventory check, there is a role for a counting scale in every business. Counting can take place in many areas of a business and is involved in the entire lifecycle of a product from R&D to production and warehousing. OHAUS balances are found in QA/QC labs as well as in production areas – wherever ultra-high precision counting is required, while OHAUS Scales can be used to count skids or totes of parts up to 3 000 kg.

Parts Counting can be done by adding pieces up to a target count into a box, it can be done by Filling to a range of parts in a box, and it can be used to quickly Check – Yes or No — the count of parts in a box in inventory. Counting scales are used for adding parts to a kit for later assembly, for controlling lean manufacturing inventory, as well as for ongoing or annual warehouse inventory audits.

Capacity

The nominal value of the weighing range.

Displayed Resolution

The smallest weight it can show on the display, calculated by taking the capacity of the scale and dividing by the readability.

APW

Average Piece Weight

Internal Counting Resolution

The number of divisions into which it divides the total capacity of the scale.

Minimum APW

Smallest APW that can be determined by the scale

Minimum Sample Weight

Smallest sample required for sampling.

+ / - / 0 means the product can perform positive (into a box), negative (out of a full box) or zero Check Counting.

+ / - means the product can sample either into a box (+ sampling) or out of a full box (- sampling).

"Supporting Balance" means that the product can connect by RS232 to an OHAUS Ranger 7000 or Defender 5000 and provide an ultra-precise APW.

With its 2 000 item library, the commonly used parts information can be stored for fast recall using the keyboard or optional barcode scanner. Counting results can be easily transferred to PC via the RS232/USB/Ethernet interfaces and the parts data in the Ranger 7000 can be maintained using OHAUS

ScaleMate software. With these features, a complete inventory control system can be set up making the Ranger 7000 is the best tool for counting.

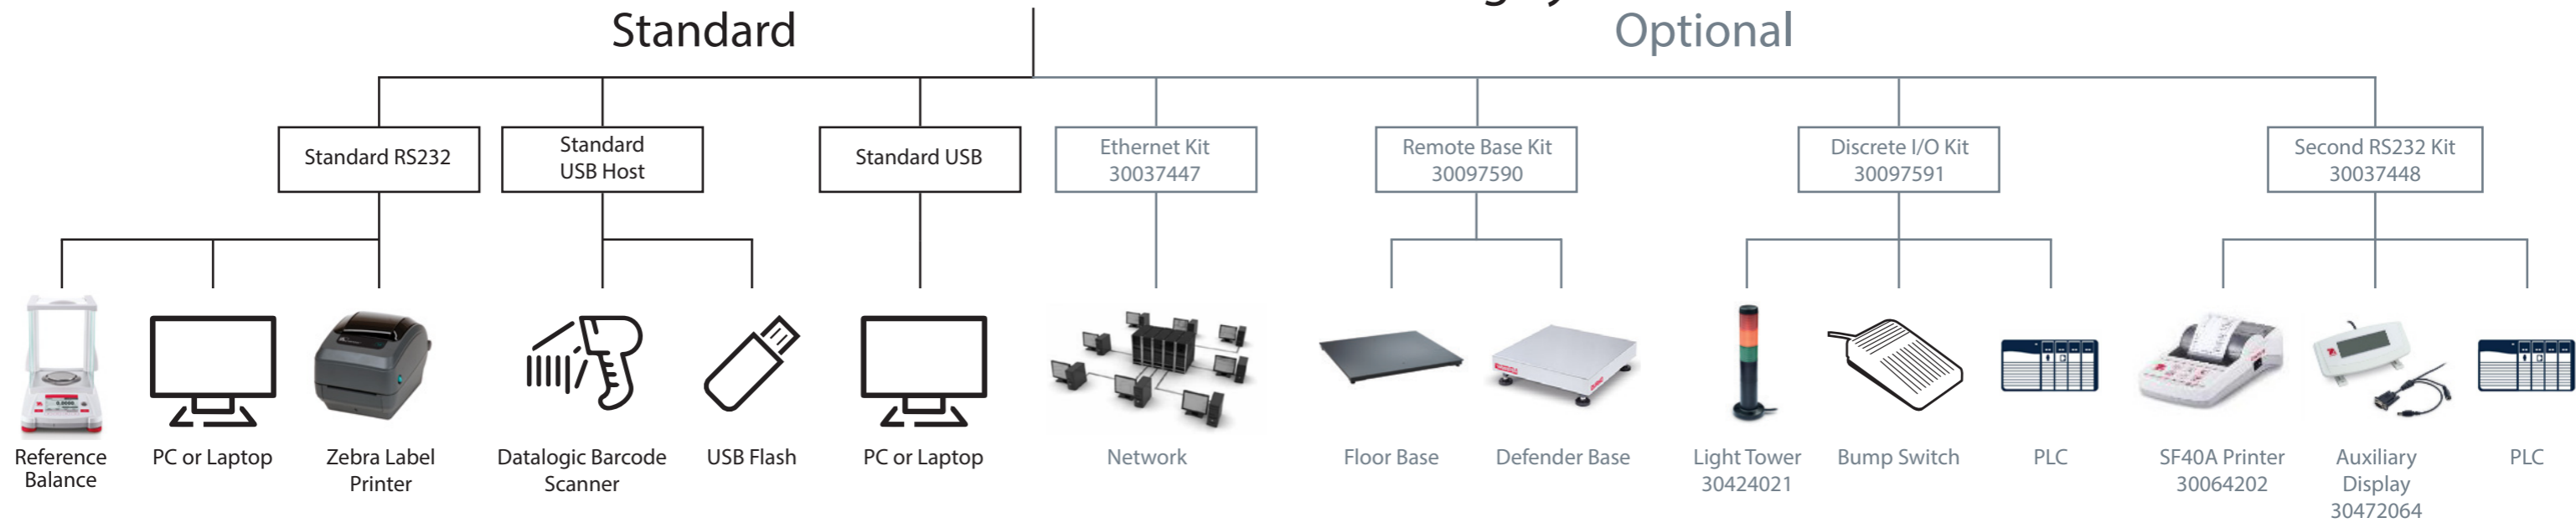

In luxury eye glasses manufacturing segment, customers use an OHAUS reference balance for more accurate parts weights for high-cost titanium alloy components. The Ranger 7000 recalculates the APW (Average Piece Weight) during counting, increasing accuracy with each lot. A remote base (like a floor scale platform) with higher capacity can be connected with the optional kit to the Ranger 7000 in order to achieve precise results for large bins and totes of parts.

The Ranger Count 4000 is widely used in manufacturing for packaging and inventory control where durability, mobility and standard counting resolution is a must. Counting results can be read within one second, improving working efficiency and the full cast metal housing and frame ensure that the Ranger Count 4000 stands up to heavy industrial use. The Ranger Count 4000 stores 30

items in its library for easy recall and the included RS232 interface can be used to connect to a system or printer.

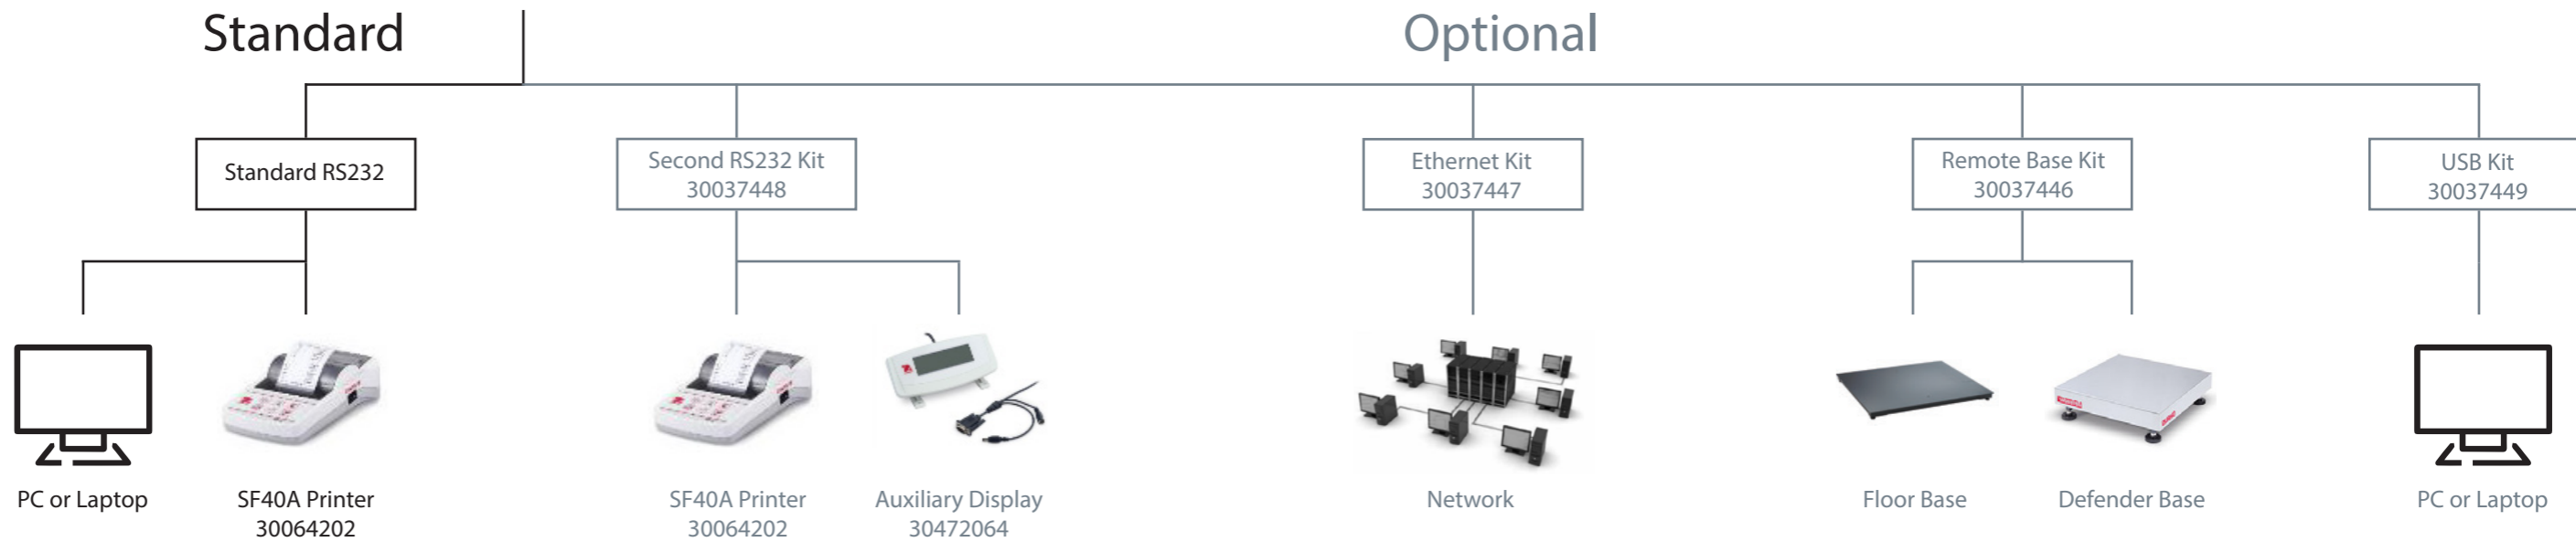

The optional Second RS232, USB or Ethernet kits offer additional connectivity capabilities. A remote base (like a floor scale platform) with higher capacity can be connected with the optional kit in order to achieve precise results for large bins and totes of parts. All these features make Ranger 4000 the durable choice for mobile counting.

Industries like machinery manufacturing run on handling a wide range of parts and assemblies, from small lots in parts bins up to totes and skids in the warehouse. Not only are parts often expensive, requiring cost control, but the wrong set of parts can bring the assembly line to a halt.

Combining a high counting resolution with capacities up to 600 kg, multiple connectivity options, and all-steel construction, the Defender 5000 bench scale is an idea solution for the manufacturing industry. For light or high-cost parts,

the Defender 5000 can pull sample weights from an ultra-precision balance or use known part information in memory. For the needs of complex industrial applications, the Defender 5000 is an excellent combination of strength and brains.

Defender 3000 Series Floor Scales are the value solution for wet and dry weighing needs in industrial & commercial applications. Their high-quality material and construction are designed to minimize distortion under heavy loads, and ensure years of dependable performance. Available with corresponding ramps and mounting accessories, Defender 3000 floor scales offer a unique combination of value, quality and dependability that you can rely on.

Many industries, like those using expensive titanium parts in aerospace, need to combine the power of an analytical balance with the counting abilities of a bench scale to keep costs under control and accurately track inventory. Our best balance, the Explorer, has the ability to resolve part APWs down to 0.001mg, bringing ultra precision to inventory control and warehousing. The Ranger 7000 and Defender 5000 can instantly combine with the

Explorer balance to provide one of the most powerful counting systems on the market. Once connected using the RS232 ports, the APW information from the OHAUS Explorer can be instantly read by the Ranger 7000 or Defender 5000, combining ultra precision with bulk weighing.

On its own, the Explorer gives you all the features of a standard counting scale in a balance – quick APW enhancement, manual entry of known APW values, intuitive Check Counting with preset limits, and storage of up to 99 items in memory. The Explorer also provides the ability to guide Filling by Count to within +/- 1 piece, with a Filling bar display that switches when the Fill is above 90% of the target to show even more precisely the range between 90% and 100% of the target.

Counting is more than just an Industrial application. When it comes to high-value components, such as screws made from titanium alloy, a high-resolution balance must be used.

High strength, good rigidity and lightweight make the cost of titanium alloy much more expensive than steel and aluminum. In order to avoid waste and cost increase during packaging, precise counting work for this kind of high-value components is required by manufacturers.

Scout STX sets new standards in laboratory and industrial weighing. Thanks to the big, colour touchscreen, operating the Scout is so intuitive that your customers won't even need to read the manual. Moreover it has 10 times capacity rated overload protection which makes balance durable in demanding environment. 9 built in application modes make even the most complex weighing tasks easy to perform. From check weighing and parts counting to shipping and receiving, trust the Scout for accurate and reliable results.

Ruggedly constructed and multifunctional, the Navigator is a powerful balance that can handle a diverse range of weighing applications with features such as fast stabilization time, overload protection at four times its rated capacity and easy operation. Navigator is ideal to be used in light to medium duty industrial applications, including paint and ink mixing, packaging, sampling and parts counting.

FAQs

1. How Can I Sample Precisely?

- Sample and count the same part – do not mix parts
- Make sure your sample comes from different times in your production cycle
- Make sure your part does not change due to moisture
- Dirt and oil will affect the accuracy of part counts
- Check your APW periodically – once a shift or once a day – to ensure that your part weight has not changed.
- Use Auto Optimization to ensure that the sample of parts is large enough to average out any differences in weights – 100 pieces in a sample is a good rule of thumb
- Use the most precise scale to ensure that your counts are accurate

2. How Can Barcoding Save Time?

Using a barcode scanner with part information already in a Ranger 7000 's or Defender 5000's library memories ensures that the box tare weight and part APW are recalled quickly and accurately each time, eliminating loss from inputting the wrong weights. A barcode label printer not only can print a fast label with the part barcode on it, it can also add information on the date and time, the part name and the net weight of the package, taking handwritten errors out of the equation. Using barcoding overall can eliminate operator errors, reduce loss and costs, and increase the accuracy of the information you are giving your customers.

3. Why Do We Need a Reference Balance?

With the reference balance, we can get a much more precise average piece weight than a regular counting scale can produce, which leads to a more accurate counting result. It's commonly used to count the small, light, high value parts.

Choose the Right Counting Scale

- **What is the weight of the lightest part?**
The lightest part should be x 2 the minimum APW
- **How much do the boxes weigh (parts plus box)?**
The capacity of the scale should be x 2 the heaviest box
- **How big is the largest box you will be using?**
Scales can range from 17 x 14 cm all the way to 150 x 200 cm
- **Where will the scale be used—on a bench or floor?**
Higher capacity bases are usually used on the floor
- **How rough is the environment?**
Look for metal housings and thick stainless steel pans
- **Do you need battery power?**
Battery powered scales are great for portable use
- **Do you need to count on more than one platform?**
If you do, look for a Remote Base or Second Scale connections
- **Do you need to store information on multiple parts?**
Get more memories than the number of parts you have
- **Do you need a barcode reader and/or label printer?**
Barcode systems increase speed and accuracy of counts

Where Can You Use Counting Scales?

- Fastener and metal parts manufacturing
- Plastic parts injection molding lines
- Parts bins, in-process inventory locations
- Warehouses and distribution hubs
- Production lines and assembly areas
- Wholesale and retail locations
- Foodservice and catering halls
- Hardware stores, plumbing supply houses
- any place that you count, you will need a counting scale!

OHAUS Corporation

Headquartered in Parsippany, New Jersey, OHAUS Corporation is a global leader in manufacturing an extensive line of weighing products, laboratory equipment and analytical instruments that meet and surpass the weighing and measurement needs of a broad range of industries, including laboratory, industrial, educational, food preparation and retail markets. An ISO 9001:2015 manufacturer, OHAUS develops products that are precise, reliable, affordable and backed by industry-leading customer support.
